

Figure 1. 1-hr averaged local sensitivities of (a) O_3/NOz and (b) $H2O2/HNO3$ w.r.t. reaction rate constants under moderately-polluted (Rural), polluted (Urban) and heavily-polluted (Heavypoll) clear air conditions. Shown are the most influential reactions and their sensitivities.

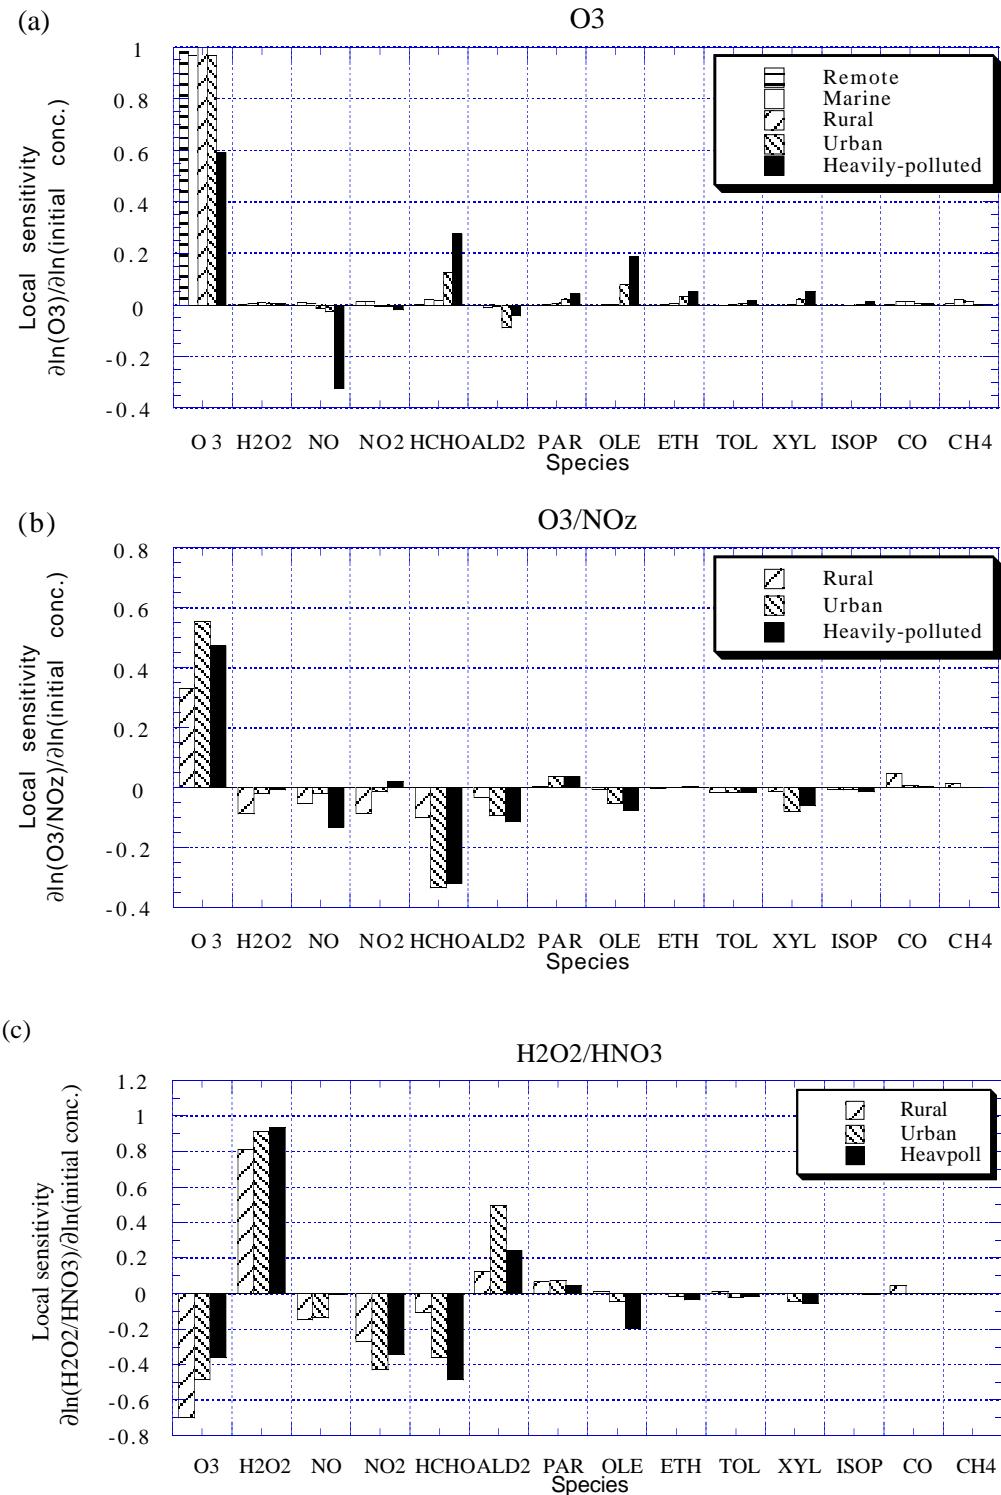

Figure 2. 1-hr averaged local sensitivities of (a) O_3 , (b) O_3/NO_z and (c) H_2O_2/HNO_3 w.r.t. species initial concentrations under various clear air conditions. Shown are the most influential species and their sensitivities.

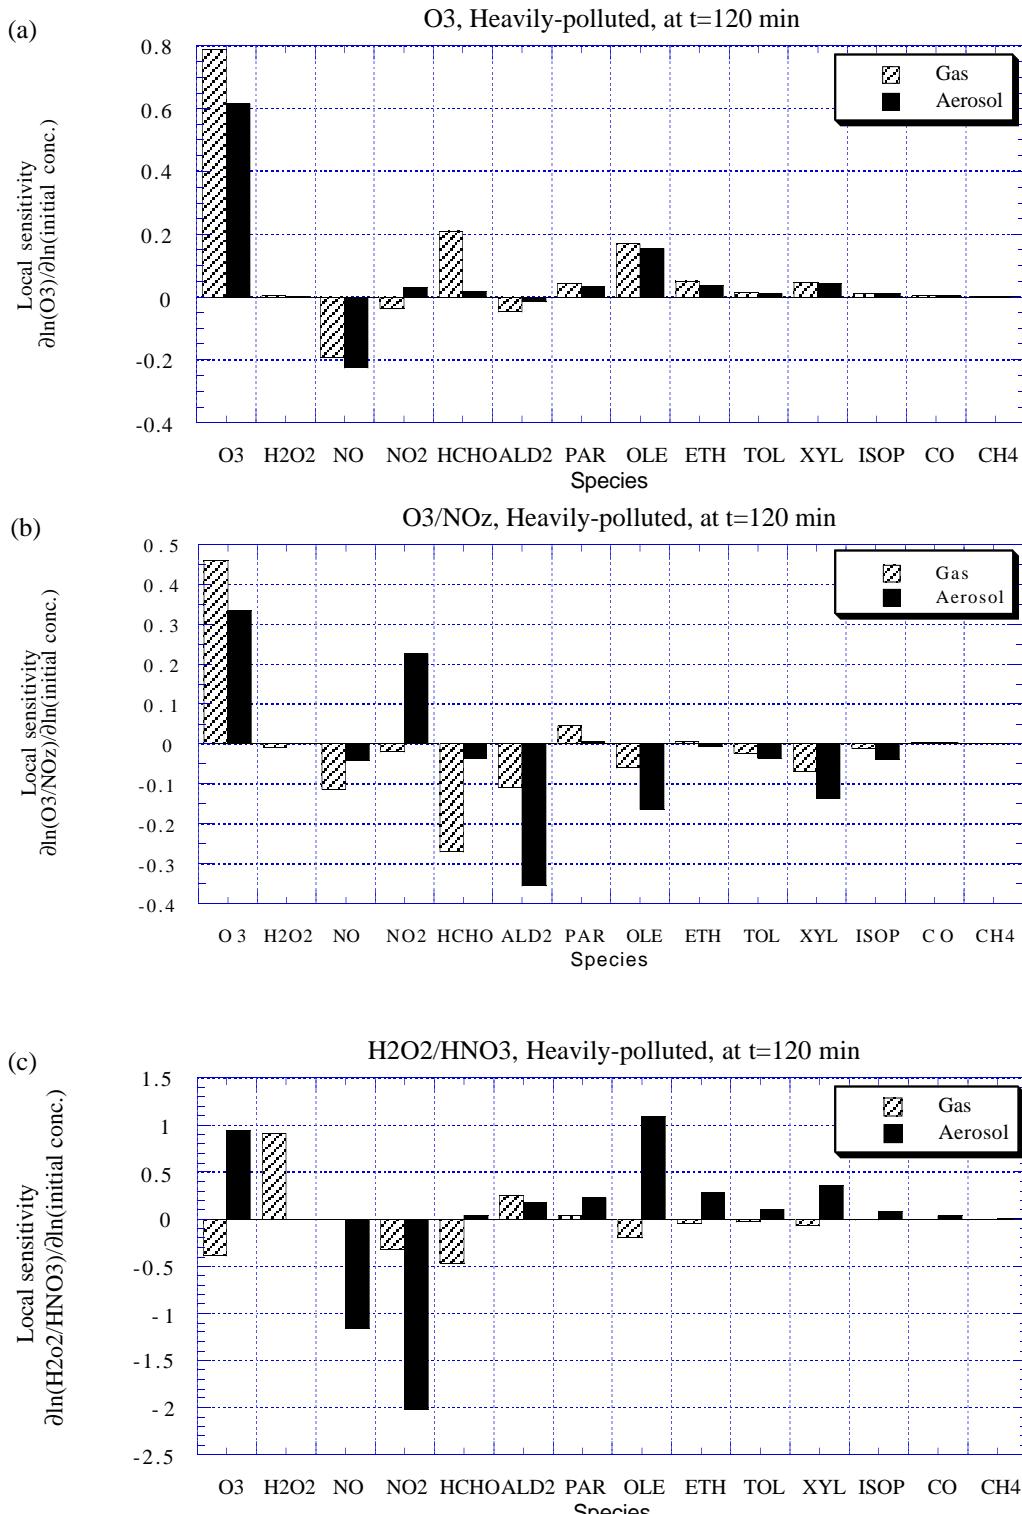

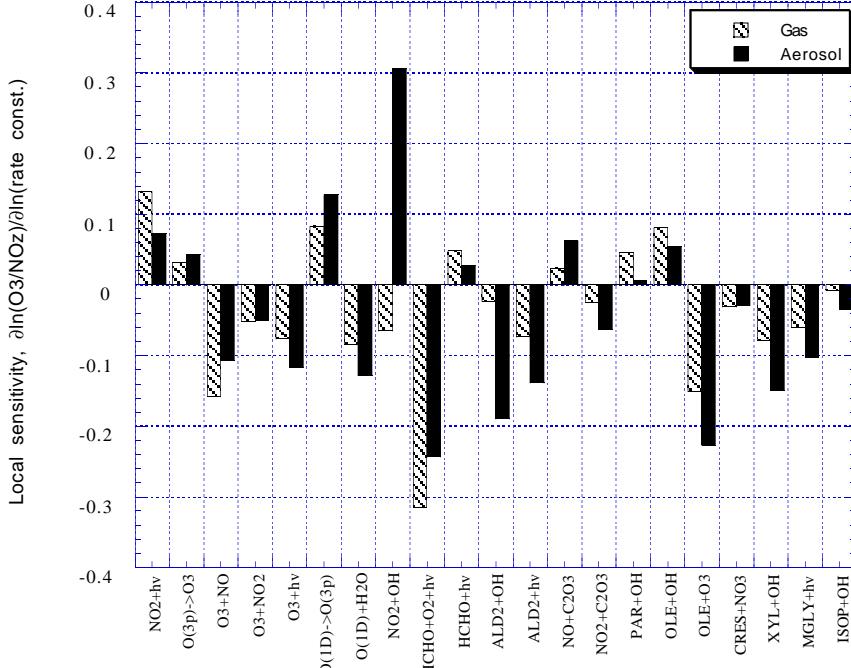

Figure 3. Local sensitivities of (a) O₃, (b) O₃/NO₂ and (c) H₂O₂/HNO₃ w.r.t. species initial concentrations at t=120 minutes in the absence (Gas) and presence (Aerosol) of aerosols under heavily-polluted (Heavpoll) conditions. Shown are the most influential species and their sensitivities.

(a)

O₃/NO_z, Heavily-polluted, at t=120 min.

(b)

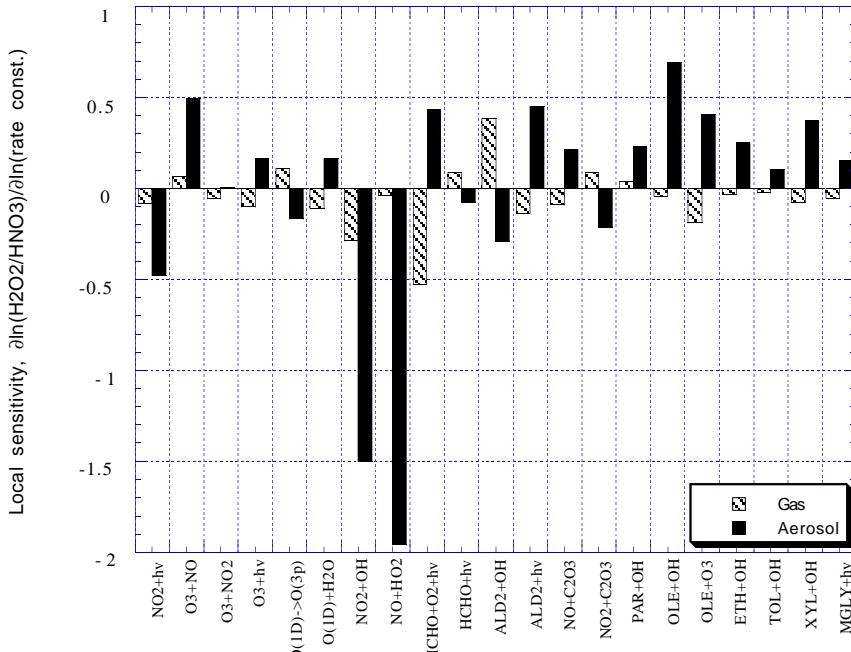

H₂O₂/HNO₃, Heavily-polluted, at t=120 min.

Figure 4. Local sensitivities of (a) O₃/NO_z and (c) H₂O₂/HNO₃ w.r.t. reaction rate constants at t=120 minutes in the absence (Gas) and presence (Aerosol) of aerosols under heavily-polluted (Heavpoll) conditions. Shown are the most influential reactions and their sensitivities.
